Title: >US-08-991-628-6
Description: (1-15) from US08991628.pep
Perfect Score: 109
Sequence: 1 SARTLNNRYTGPYTF 15

Scoring table: PAM 150 Gap 15

Searched: 188963 seqs, 23686106 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: a-geneseg35 1:genesegp

Statistics: Mean 19.232; Variance 58.683; scale 0.328

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Fused protein recognised by pemphigus vulgaris auto:antibody - useful to treat and diagnose pemphis vulgaris (laim 1; Page 7-9; 9pp; Japanese. W07908 represents the human pemphigus vulgaris (PV) antigen extracellular region. The PV antigen is produced in patients with pemphis vulgaris resulting in autoimmune disease. PV is a rare relapsing disease causing suprabasal, intra-epidermal bullae vesicles) of the skin and mucous membranes, which is fattal if untreated. The PV antigen was fused to a human IgGl hinge region and the resulting fusion protein is useful to treat or diagnose
                                                                                                                                                                                                                                                                                                                     DNA encoding pemphigus vulgaris antigen - useful in proteins for diagnostic and therapeutic uses Disclosure, Fig 7; SOpp; English.
This sequence is the pemphigus vulgaris 130kD antigen. The prote and its encoding DNA may be used in the diagnosis and treatment pemphigus vulgaris. It is thought that the antigen may be a cell adhesion molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            14-JUN-1993 (first entry)

Disclosure; Fig 49; 209pp; English.

The proteins derived from the nematode DNA may be used vaccines against parasitic infection of plants, humans esp. sheep. MADs may also be raised to provide passive prophylaxis against infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    R12098
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Protein from Haemonchus contortus and other nematodes - therapeutic and prophylactic agent to protect plants, an humans from parasitic nematode infection.

Disclosure, Fig 49; 209pp; English.

The proteins derived from the nematode DNA may be used to vaccines against parasitic infection of plants, humans a esp. sheep. MAbs may also be raised to provide passive to prophylaxis against infection.

Recombinant mCRF-RB1 can be expressed in host cells transformed by the cDNA clone. The receptor can be used to identify agonists and antagonists that modulate the signal transduction activity mediated by CRF receptors. It may be administered therapeutically to reduce high ACTH levels caused by
                                                                                                                                                                                                                                                                                                                                      Isolated corticotropin-releasing factor receptor (CRF-R) - used to develop prods. for modulating signal transduction activity mediated by CRF-R

Claim 13; Page 22; 40pp; English.

The synthetic gene encodes a protein corresponding to an antibody capable of binding to a specific antigen, in this case the HIV-1 tall protein. Many synthetic genes are synthesised, each containing a predetermined nucleotide region encoding the framework regions of the heavy and light chains of antibody and undetermined nucleotide regions which are random sequences. The genes are then used in the construction of vectors which are subsequently used to transform microbes. The proteins thus produced are screened for binding activity to the apposition anticody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antibodies; antigen binding proteins; library; Human Immunodeficiency Virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Enzyme expression vector - giving transformant enzymes be used as host enzymes in polypeptide biosynthesis. Disclosure. Fig 4; 12pp; Japanese.
The vector may be used to express heterologous genes from transformed host when galactose is added as a carbon so Sequence 91 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a specific example of a chimeric integrase made up of three domains from MoMLV and Ty3, with at least one domain derived from Ty3 integrase. This protein can direct integration of a vector construct into a defined region of a target eukaryotic genome. As part of gene delivery vehicles and transduction competent recombinant retroviral particles it can be useful in somatic and germ cell gene therapy (in vivo or ex vivo) of a wide range of genetic, infectious, degenerative, inflammatory, cardiovascular and autoimmune diseases or cancer. Typical examples of the many potential applications include treatment of HIV infection, haemophilia, Alzheimer's disease and rheumatoid arthritis. This protein rather than wild-type retroviral integrase reduces the rate of insertional mutagenesis and the degree of variation in gene expression, and particularly does not disrupt than any constant of the protein rather than wild-type retroviral integrase reduces the rate of insertional mutagenesis and the
                                                                                                                                                                                                   16-JUL-1997 (first entry)
Chimeric MoMLV and Ty3 integrase designated AmBtCm.

CC The present sequence is a specific example of a chimeric integrase.

CC made up of three domains from MoMiv and Ty3, with at least one domain control of three domains from MoMiv and Ty3, with at least one domain control of the present sequence. This protein can direct integration of a concentrative into a defined region of a target eukaryotic genome. CC As part of gene delivery vehicles and transduction competent cc recombinant retroviral particles it can be useful in somatic cc and germ cell gene therapy (in vivo or ex vivo) of a wide range of CC genetic, infectious, degenerative, inflammatory, cardiovascular and cc autoimmune diseases or cancer. Typical examples of the many potential applications include treatment of HIV infection, haemophilia, Alzheimer's cc disease and rheumatoid arthritis. This protein rather than wild-type cc degree of variation in gene expression, and particularly does not disrupt trake of the present sequence is not shown in the specification, but is cade up from the two original sequences as specified, MoMLV and Ty3, which are shown.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Best Loc

Rat corticotropin-releasing factor-2-beta (CRF2-beta) receptor (R90575) is a membrane-bound G-coupled protein receptor involved in signal transduction. It can be produced by expression of encoding cDNA (T12244) in procaryotic or encaryotic host cells. Recombinant CRF2 receptor is used to screen CRF2 receptor agonists and antagonists of therapeutic appln., and to prepare antibodies which specifically bind to CRF2 receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Lovenberg TW, Olte

PS Claim 32: Column 45-52; 70pp: English
CC This sequence represents a murine leukaemia virus (MuLV) reverse
CC transcriptase. The invention relates to a method of producing double
CC transcriptase. The invention relates to a method of producing double
CC murine leukaemia virus reverse transcriptase (xM-MuLV). The method, the
CC murine leukaemia virus reverse transcriptases and nucleic acids disclosed may be
CC cloned, cDNA ilbraries. Use of the method to construct cDNA libraries
CC cloned, cDNA libraries. Use of the method to construct cDNA libraries
CC ensures that the reverse transcriptase is able extend the first strand of
CC the cDNA up to the ultimate 5' end of the mRNA, therefore ensuring that
CC all sequences are represented in the library, whereas previously, some
CC sequences would be lost due to incomplete transcription (e.g. as a result of RNAse
CC of hairpin loop formation) or mRNA degradation (e.g. as a result of RNAse
CC and proteins present in the cell will repair any mistakes or nicks in the
CC and proteins present in the mRNA for insertion into a vector by adding the
CC the method provides a convenient way of priming it for cDNA synthesis. Also,
CC clones
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁

This protein can direct integration of a vector construct into a defined region of a target eukaryotic genome. As part of gene delivery vehicles and transduction competent recombinant retroviral particles it can be useful in somatic and germ cell gene therapy (in vivo or ex vivo) of a wide range of genetic, infectious, degenerative, inflammatory, cardiovascular and autoimmune diseases or cancer. Typical examples of the many potential applications include treatment of HIV infection, hemophilia, Alzheimer's disease and rheumatoid arthritis. This protein rather than wild-type retroviral integrase reduces the rate of insertional mutagenesis and the degree of variation in gene expression, and particularly does not disrupt than any correction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                LT 13

          Claim 28; Page 91; 133pp; Japanese.

Claim 28; Page 91; 133pp; Japanese.

The present sequence is the light chain variable region of the anti-human Fas ligand monoclonal antibody (MAD) NOK-5. NOK-5 is produced by the hybridoma NOK-5 (FERM BP-5048), which was prepared by immunising mice with transformed human Fas ligand expressing COS cells, and fusing spleen cells isolated from the mice with myeloma P3x63Ag8 653 (ATCC CRL-1580) cells. The MAD recognises the human P3x63Ag8 653 (ATCC CRL-1580) cells. The MAD recognises the human fas ligand on the cell surface or in solution, and can be used to inhibit the apoptosis inducing cell surface Fas ligand/Fas reaction. The MAD can also be used for a Fas ligand assay in biological samples (e.g. human blood), especially for disease diagnosis, e.g. hepatitis, infectious mononucleosis and systemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      29-MAY 1997 (first entry) variable light chain of anti-human Fas ligand antibody NOK-5. Variable region; light chain; human; Fas ligand; monoclonal; antibody; NOK-5; hybridoma; inhibition; apoptosis; assay; diagnosis; disease; hepatitis; infectious mononucleosis; systemic lupus erythematosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          N-PSDB; 094266.

RFB-14 retrovirus genome - and prodn. of osteo-inductive proteins Claim 14; Fig 1; 46pp; German.

Claim 14: Fig 1; 46pp; German.

The full-length proviral genomic sequence of retrovirus RFB-14 has been determined. The virus codes for an osteoinductive protein, although the precise location of the coding region has not yet been identified. The virus may be useful in gene therapy of bone growth disorders such as osteoporosis. The present sequence is that of the sequence 1196 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DE4411718-A1.

Title: VJS-08-991-628-6
Description: (1-15) from US08991628.pep
Perfect Score: 109
Sequence: 1 SARTLNNRYTGPYTF 15

Tabular output not generated.

Sequence: 1 SARTLNNRYTGPYTF 15
Scoring table: PAM 150
Gap 15

Searched: 83857 segs, 30454973 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

swiss-prot38 1:swissprot

Statistics: Mean 27.244; Variance 33.691; scale 0.809

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Over-expression of GATA-6 in xenopus embryos blocks differentiation
of heart precursors.";
EMBO J. 16:355-368(1997).

-I- FUNCTION: ASSOCIATED WITH CARDIAC SPECIFICATION AND CAN REGULATE
CARDIAC-SPECIFIC TRANSCRIPTION DURING EMBRYOGENESIS. ACTIVATES
THE EXPRESSION OF CARDIAC MHC-ALPHA IN VIVO.

-I- SUBCELLULAR LOCATION: NUCLEAR.
-I- SIMILARITY: BELONGS TO THE GATA-TYPE TRANSCRIPTION FACTOR FAMILY.
                                                                                             This SWISS-PROT entry is copyright. Complete genome sequence of Methanobacterium thermoautotrophicum
deltaH: functional analysis and comparative genomics.*;
A Bacteriol. 179:7135-7155(1997).
C -!- FUNCTION: THE KEY ENZYMATIC REACTIONS IN NITROGEN FIXATION ARE
CATALYZED BY THE NITROGENASE COMPLEX, WHICH HAS 2 COMPONENTS: THE
CATALYZED BY THE MOLYSDENUM-IRON PROTEIN.
C -!- CATALYTIC ACTIVITY: 8 REDUCED FERREDOXIN + 8 H(+) + N(2) + 16 ATP
- 8 OXIDIZED FERREDOXIN + 2 NH(3) + 16 ATP + 16 ORTHOPHOSPHATE.
C -!- SUBUNIT: TETRAMER OF TWO ALPHA AND TWO BETA CHAINS THAT BINDS
C -!- SUBULTARTY: BELONGS TO THE NIFD/NIFK/NIFE/NIFN FAMILY.

Statistics: Mean 26.282; Variance 35.962; scale 0.731

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA encoding pemphigus vulgaris antigen - useful in proteins for diagnostic and therapeutic uses Disclosure, Fig 7; 50pp; English.

This sequence is the pemphigus vulgaris 130kD antigen. The protein and its encoding DNA may be used in the diagnosts and treatment of pemphigus vulgaris. It is thought that the antigen may be a cell adhesion molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human pemphigus vulgaris 130kD antigen.

Disclosure; Page 4; llpp; English.
The nod L gene product may be used to nod- mutants of Bradyrhizobium or enhance nodulating ability.
Sequence 140 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 agent
Claim 2; Page 13-14; 28pp; Japanese.
Claim 2; Page 13-14; 28pp; Japanese.
This sequence represents the topolsomerase II binding protein (TopBP)
the invention. The TopBP protein is useful as an anticancer agent. Top
can be used as the target molecule for anticancer agent.
Sequence 392 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     17-SEP-1997; 251544.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding MHC class II trans-activator polypeptide(s) - useful re.g. as primers for enzymatic amplification, as detection probes or as inhibitors of expression of genes encoding MHC in dendritic cells in disclosure; pages 66-99; 86pp; French.

The present sequence represents type IV CIITA (class II transactivator) protein. The products can be used to treat diseases for which enhanced expression of genes coding for MHC class II molecules is desired, especially where the enhanced expression is desired in dendritic cells or after induction by a cytokine, especially interferon-gamma or interleukin-4. Inhibitors of the gene or protein coding for MHC class II molecules is coding for MHC class II molecules is desired or ancer treatment.

CC (CIITA) polypeptide. The N-terminal region of the wild type CIITA is

CC (CIITA) polypeptide. The N-terminal region of major

CC (CIITA) polypeptide. The N-terminal region of major

CC histocompatibility complex (MIC) class I antigens. A ribozyme targeted

CC obases 1159-1161 (GUA) of human CIITA mRNA, or corresponding target in

CC other species and the CIITA polypeptide can be used to reduce expression

CC disease (e.g. arthritis and diabetes) or to treatment of autoimmune

CC disease (e.g. arthritis and diabetes) or to treat non-human animals

CC intended as source of xenografts. The ribozyme and the CIITA polypeptide

CC may be generated in vivo by gene therapy, using the encoding nucleic

CC acids targeted for localised suppression of the immune response. Material

CC transfected with the CIITA encoding nucleic acids are used for animal-to-

CC class II antigens, in cells that express them constitutively or after

CC class II antigens, in cells that express them constitutively or after

CC competitively inhibits endogenous CIITA.

CC competitively inhibits endogenous CIITA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents type II CIITA (class II transactivator) protein. The products can be used to treat diseases for which enhanced expression of genes coding for MHC class II molecules is desired, especially where the enhanced expression is desired in dendritic cells or after induction by a cytokine, especially interferon-gamma or interleukin-4. Inhibitors of the gene or protein can be used to treat diseases for which reduced expression of genes coding for MHC class II molecules is desired or can be used as vaccines, especially for cancer treatment.
                                                                                    binding_site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       28-OCT-1998.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Frue; Westin.

For Gene encoding a protein displaying class II trans-activator

FT Gene encoding a protein in compan. for treating diseases associated

FT with impaired expression of MHC-II genes, etc.

FX Claim II; Page 17-21; 32pp; English.

CC This protein sequence is encoded by the gene represented in Q88110.

CC This protein is a class II gene expression in Blymphocytes. The DNA

CC control of MHC class II gene expression in Blymphocytes. The DNA

CC sequence has two in frame start codons. The first of these is at position

CC sequence has two in frame start codons. The first of these is at position

CC sequence has two in frame start codons and the second is present

CC and acts as the translation initiation site. The second is present

CC contains three stretches rich in proline/serine/threonine. It also

CC contains a region rich in glutamate/aspartate (an acidic region) and an

CC ATP/GTP binding cassette. The acidic regions followed by three stretches

CC rich in proline, serine and threonine resembles a transcription

CC acids 979 to 1061 that shows weak homology with the N terminal portion of

CC acids 979 to 1061 that shows weak homology with the N terminal portion of

CC sequence can be used to treat diseases where a decrease in the level of

CC expression of MHC cells II genes is desired e.g. insulin dependant

CC diabetes, multiple sclerosis, lupus erythematosis and rheumatoid

CC contains.

CC contains and the level of

CC contains and the level of

CC contains and the level of

CC contains and the level of

Nethods which inhibit transcription activation by CIITA - causes inhibition of MHC class II gene expression, used in therapy of auto:immune disorders

Example 1; Page 36-41; 64pp; English.

A genomic DNA sequence (T18028) codes for the class II transactivator. CIITA (R81569), a protein essential for activation of transcription of MHC class II genes. The CIITA transcription activation domain provides useful information for identifying cpds. which inhibit CIITA-dependent transcription. Such cpds. are potential autoimmune disease therapeutics by virtue of their ability to inhibit transcription of the MHC class II genes. A second portion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Class II transactivator.                                                                                                                                                                       This represents a class II trans activator (CIITA) polypeptide. When the N-terminal region of the CIITA is deleted, it can be used for reducing the expression of major histocompatibility complex (MHC) class II antigens. A ribozyme targeted to bases 1159-1161 (GUA) of human CIITA mRNA, or corresponding target in other species and the CIITA polypeptide can be used to reduce expression of MHC class II antigens, particularly for treatment of autoimmune disease (e.g. arthritis and diabetes) or to treat non-human animals intended as source of kenografts. The ribozyme and the CIITA polypeptide may be generated in vivo by gene therapy, using the encoding nucleic acids targeted for localised suppression of the immune response. Material from transgenic animals in which at least some cells are stably transfected with the CIITA encoding nucleic acids are used for animal-to-human transplantation. The CIITA polypeptide suppresses synthesis of class II antigens, in cells that express them constitutively our after lymphokine induction. It has no transcription activity but still binds to regulatory proteins in the promoter region of class II genes, so competitively inhibits endogenous CIITA.

PT DNA encoding MHC class II trans-activator polypeptide(s) - useful PT e.g. as primers for enzymatic amplification, as detection probes or as inhibitors of expression of genes encoding MHC in dendritic cells CC The present sequence represents a type I CIITA (class II transactivator) CC protein. The products can be used to treat diseases for which CC enhanced expression of genes coding for MHC class II molecules is CC desired, especially where the enhanced expression is desired in CC dendritic cells or after induction by a cytokine, especially CC interferon-gamma or interleukin-4. Inhibitors of the gene or protein CC can be used to treat diseases for which reduced expression of genes CC coding for MHC class II molecules is desired or can be used as vaccines, coding for Class II molecules is desired or can be used as vaccines,

The present sequence represents type III CITA (class II transactivator) protein. The products can be used to treat diseases for which enhanced expression of genes coding for MHC class II molecules is desired, especially where the enhanced expression is desired in dendritic cells or after induction by a cytokine, especially interferon-gamma or interleukin-4. Inhibitors of the gene or protein can be used to treat diseases for which reduced expression of genes coding for MHC class II molecules is desired or can be used as vaccines, especially for cancer treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 21-APR-1998; 400968.

Statistics: Mean 23.943; Variance 29.203; scale 0.820

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Title: >US-08-991-628-7

Description: (1-15) from US08991628.pep
Perfect Score: 99
Sequence: 1 OSGTMRTRHSTGGTN 15

Scoring table: PAM 150 Gap 15

Searched: 83857 seqs, 30454973 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot38 1:swissprot

Statistics: Mean 24.519; Variance 27.183; scale 0.902

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
